

MC10E445, MC100E445

5V ECL 4-Bit Serial/Parallel Converter

Description

The MC10/100E445 is an integrated 4-bit serial to parallel data converter. The device is designed to operate for NRZ data rates of up to 2.0 Gb/s. The chip generates a divide by 4 and a divide by 8 clock for both 4-bit conversion and a two chip 8-bit conversion function. The conversion sequence was chosen to convert the first serial bit to Q0, the second to Q1 etc.

Two selectable serial inputs provide a loopback capability for testing purposes when the device is used in conjunction with the E446 parallel to serial converter.

The start bit for conversion can be moved using the SYNC input. A single pulse applied asynchronously for at least two input clock cycles shifts the start bit for conversion from Qn to Qn-1. For each additional shift required an additional pulse must be applied to the SYNC input. Asserting the SYNC input will force the internal clock dividers to "swallow" a clock pulse, effectively shifting a bit from the Qn to the Qn-1 output (see Timing Diagram B).

The MODE input is used to select the conversion mode of the device. With the MODE input LOW, or open, the device will function as a 4-bit converter. When the mode input is driven HIGH the data on the output will change on every eighth clock cycle thus allowing for an 8-bit conversion scheme using two E445's. When cascaded in an 8-bit conversion scheme the devices will not operate at the 2.0 Gb/s data rate of a single device. Refer to the applications section of this data sheet for more information on cascading the E445.

Upon power-up the internal flip-flops will attain a random state. To synchronize multiple E445's in a system the master reset must be asserted.

The V_{BB} pin, an internally generated voltage supply, is available to this device only. For single-ended input conditions, the unused differential input is connected to V_{BB} as a switching reference voltage. V_{BB} may also rebias AC coupled inputs. When used, decouple V_{BB} and V_{CC} via a 0.01 µF capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{BB} should be left open.

The 100 Series contains temperature compensation.

Features

- On-Chip Clock ÷4 and ÷8
- 2.0 Gb/s Data Rate Capability
- Differential Clock and Serial Inputs
- V_{BB} Output for Single-Ended Input Applications
- Asynchronous Data Synchronization
- Mode Select to Expand to 8-Bits
- PECL Mode Operating Range: V_{CC} = 4.2 V to 5.7 V with V_{EE} = 0 V
- NECL Mode Operating Range: V_{CC} = 0 V with V_{EE} = -4.2 V to -5.7 V
- Internal Input 50 kΩ Pulldown Resistors

- ESD Protection: Human Body Model; > 2 kV, Machine Model; > 100 V
- Meets or Exceeds JEDEC Spec EIA/JESD78 IC Latchup Test
- Moisture Sensitivity Level: Pb = 1; Pb-Free = 3 For Additional Information, see Application Note AND8003/D
- Flammability Rating: UL 94 V-0 @ 0.125 in, Oxygen Index: 28 to 34
- Transistor Count = 528 devices
- PECL Mode Operating Range: V_{CC} = 4.2 V to 5.7 V with V_{EE} = 0 V
- Pb-Free Packages are Available*

*For additional information on our Pb-Free strategy and soldering details, please download the ON Semiconductor Soldering and Mounting Techniques Reference Manual, SOLDERRM/D.

T_{sol}	Wave Solder	Pb Pb-Free		265	$^{\circ}\text{C}$
				265	

Maximum ratings are those values beyond which device damage can occur. Maximum ratings applied to the device are individual stress limit values (not normal operating conditions) and are not valid simultaneously. If these limits are exceeded, device functional operation is not implied, damage may occur and reliability may be affected.

Timing Diagram B. 1:4 Serial to Parallel Conversion With SYNC Pulse

Figure 4. Timing Diagrams

APPLICATIONS INFORMATION

The MC10E/100E445 is an integrated 1:4 serial to parallel converter. The chip is designed to work with the E446 device to provide both transmission and receiving of a high speed serial data path. The E445, can convert up to a 2.0 Gb/s NRZ data stream into 4-bit parallel data. The device also provides a divide by four clock output to be used to synchronize the parallel data with the rest of the system.

The E445 features multiplexed dual serial inputs to provide test loop capability when used in conjunction with the E446. Figure 5 illustrates the loop test architecture. The architecture allows for the electrical testing of the link without requiring actual transmission over the serial data path medium. The SINA serial input of the E445 has an extra buffer delay and thus should be used as the loop back serial input.

Figure 5. Loopback Test Architecture

The E445 features a differential serial output and a divide by 8 clock output to facilitate the cascading of two devices to build a 1:8 demultiplexer. Figure 6 illustrates the architecture for a 1:8 demultiplexer using two E445's; the timing diagram for this configuration can be found on the following page. Notice the serial outputs (SOUT) of the lower order converter feed the serial inputs of the the higher order device. This feed through of the serial inputs bounds the upper end of the frequency of operation. The clock to serial output propagation delay plus the setup time of the serial input pins must fit into a single clock period for the cascade architecture to function properly. Using the worst case values for these two parameters from the data sheet, TPD CLK to SOUT = 1150 ps and tS for SIN = -100 ps, yields a minimum period of 1050 ps or a clock frequency of 950 MHz.

The clock frequency is significantly lower than that of a single converter, to increase this frequency some games can be played with the clock input of the higher order E445. By delaying the clock feeding the second E445 relative to the clock of the first E445 the frequency of operation can be increased. The delay between the two clocks can be increased until the minimum delay of clock to serial out would potentially cause a serial bit to be swallowed (Figure 7).

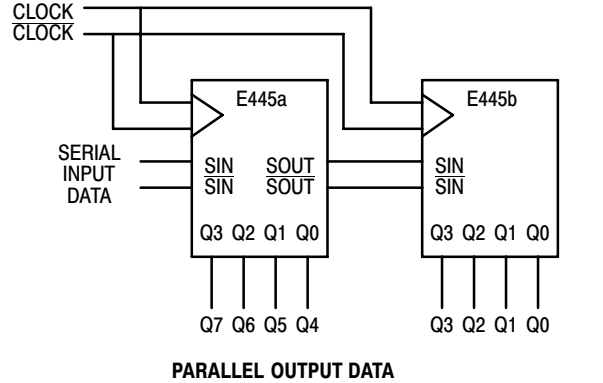

Figure 6. Cascaded 1:8 Converter Architecture

With a minimum delay of 800 ps on this output the clock for the lower order E445 cannot be delayed more than 800 ps relative to the clock of the first E445 without potentially missing a bit of information. Because the setup time on the serial input pin is negative coincident excursions on the data and clock inputs of the E445 will result in correct operation.

Figure 7. Cascade Frequency Limitation

Perhaps the easiest way to delay the second clock relative to the first is to take advantage of the differential clock inputs of the E445. By connecting the clock for the second E445 to the complimentary clock input pin the device will clock a half a clock period after the first E445 (Figure 8). Utilizing this simple technique will raise the potential conversion frequency up to 1.4 GHz. The divide by eight clock of the second E445 should be used to synchronize the parallel data to the rest of the system as the parallel data of the two E445's will no longer be synchronized. This skew problem between the outputs can be worked around as the parallel information will be static for eight more clock pulses.

ECLinPS is a trademark of Semiconductor Components Industries, LLC (SCILLC).

ON Semiconductor and **ON** are registered trademarks of Semiconductor Components Industries, LLC (SCILLC). SCILLC reserves the right to make changes without further notice to any products herein. SCILLC makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does SCILLC assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. "Typical" parameters which may be provided in SCILLC data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. SCILLC does not convey any license under its patent rights nor the rights of others. SCILLC products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the SCILLC product could create a situation where personal injury or death may occur. Should Buyer purchase or use SCILLC products for any such unintended or unauthorized application, Buyer shall indemnify and hold SCILLC and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that SCILLC was negligent regarding the design or manufacture of the part. SCILLC is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
