

Isolated High Current IGBT/MOSFET Gate Driver

NCx57090y, NCx57091y

(x = D or V, y = A, B, C, D, E or F)

NCx57090y, NCx57091y are high-current single channel IGBT/MOSFET gate drivers with 5 kVrms internal galvanic isolation, designed for high system efficiency and reliability in high power applications. The devices accept complementary inputs and depending on the pin configuration, offer options such as Active Miller Clamp (version A/D/F), negative power supply (version B) and separate high and low (OUTH and OUTL) driver outputs (version C/E) for system design convenience. The driver accommodate wide range of input bias voltage and signal levels from 3.3 V to 20 V and they are available in wide-body SOIC-8 package.

Features

- High Peak Output Current (+6.5 A/-6.5 A)
- Low Clamp Voltage Drop Eliminates the Need of Negative Power Supply to Prevent Spurious Gate Turn-on (Version A/D/F)
- Short Propagation Delays with Accurate Matching
- IGBT/MOSFET Gate Clamping during Short Circuit
- IGBT/MOSFET Gate Active Pull Down
- Tight UVLO Thresholds for Bias Flexibility
- Wide Bias Voltage Range including Negative V_{EE2} (Version B)
- 3.3 V, 5 V, and 15 V Logic Input
- 5 kVrms Galvanic Isolation
- High Transient Immunity
- High Electromagnetic Immunity
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC-Q100 Qualified and PPAP Capable
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Typical Applications

- Motor Control
- Uninterruptible Power Supplies (UPS)
- Automotive Applications
- Industrial Power Supplies
- Solar Inverters

Table 1. FUNCTION DESCRIPTION

Pin Name	No.	I/O	Description
V _{DD1}	1	Power	Input side power supply. A good quality bypassing capacitor is required from this pin to GND1 and should be placed close to the pins for best results. The under voltage lockout (UVLO) circuit enables the device to operate at power on when a typical supply voltage higher than V _{UVLO1-OUT-ON} is present. Please see Figures 9A and 9B for more details.
IN+	2	I	Non inverted gate driver input. It is internally clamped to V _{DD1} and has an equivalent pull-down resistor of 125 kΩ to ensure that output is low in the absence of an input signal. A minimum positive or negative pulse-width is required at IN+ before OUT or OUTH/OUTL responds.
IN-	3	I	Inverted gate driver input. It is internally clamped to V _{DD1} and has an equivalent pull-up resistor of 50 kΩ to ensure that output is low in the absence of an input signal. A minimum positive or negative pulse-width is required at IN- before OUT or OUTH/OUTL responds.
GND1	4	Power	Input side ground reference.
V _{DD2}	5	Power	Output side positive power supply. The operating range for this pin is from UVLO2 to its maximum allowed value. A good quality bypassing capacitor is required from this pin to GND2 and should be placed close to the pins for best results. The under voltage lockout (UVLO) circuit enables the device to operate at power on when a typical supply voltage higher than V _{UVLO2-OUT-ON} is present. Please see Figure 9C and 9D for more details.
GND2 (NCD57090A, NCD57090C)	8	Power	Output side gate drive reference connecting to IGBT emitter or MOSFET source.
GND2 (NCD57090B)	7		
GND2 (NCD57090D, NCD57090E, NCD57090F)	5		
OUT (NCD57090A, NCD57090B)	6	O	Driver output that provides the appropriate drive voltage and source/sink current to the IGBT/MOSFET gate. OUT is actively pulled low during start-up.
OUT (NCD57090D, NCD57090F)	7		
OUTH (NCD57090C)	6	O	Driver high output that provides the appropriate drive voltage and source current to the IGBT/MOSFET gate.
OUTH (NCD57090E)	7		
OUTL (NCD57090C)	7	O	Driver low output that provides the appropriate drive voltage and sink current to the IGBT/MOSFET gate. OUTL is actively pulled low during start-up.
OUTL (NCD57090E)	8		
CLAMP (NCD57090A)	7	O	Provides clamping for the IGBT/MOSFET gate during the off period to protect it from parasitic turn-on. Its internal N FET is turned on when the voltage of this pin falls below V _{CLAMP-THR} . It is to be tied directly to IGBT/MOSFET gate with minimum trace length for best results.
CLAMP (NCD57090D)	8		
CLAMP (NCD57090F)	6		
V _{EE2} (NCD57090B)	8	Power	Output side negative power supply. A good quality bypassing capacitor is required from this pin to GND2 and should be placed close to the pins for best results.

I _{PK-SRC}	Gate-driver Output Sourcing Current (maximum pulse width = 10 μs, maximum duty cycle = 0.2%, V _{DD2} = 15 V, V _{EE2} = 0 V)	-	6.5	A
I _{PK-SNK}	Gate-driver Output Sinking Current (maximum pulse width = 10 μs, maximum duty cycle = 0.2%, V _{DD2} = 15 V, V _{EE2} = 0 V)	-	6.5	A
I _{PK-CLAMP}	Clamp Sinking Current (maximum pulse width = 10 μs, maximum duty cycle = 0.2%, V _{CLAMP} = 2.5 V)	-	2.5	A
t _{CLP}	Maximum Short Circuit Clamping Time (I _{OUT_CLAMP} = 500 mA)	-	10	μs
V _{LIM} -GND1	Voltage at IN+, IN-	-0.3	V _{DD1} + 0.3	V
V _{CLAMP} -GND2	Clamp Voltage	-0.3	V _{DD2} + 0.3	V
P _D	Power Dissipation (SOIC-8 Wide Package)	-	1470	mW

NCx57090y, NCx57091y

Table 3. ABSOLUTE MAXIMUM RATINGS (Note 1) (continued)

Over operating free-air temperature range unless otherwise noted.

Symbol	Parameter	Minimum	Maximum	Unit
$T_J(\text{max})$	Maximum Junction Temperature	-40	150	°C
T_{STG}	Storage Temperature Range	-65	150	°C
ESDHBM	ESD Capability, Human Body Model (Note 2)	-	±2	kV
ESDCDM	ESD Capability, Charged Device Model (Note 2)	-	±2	kV
MSL	Moisture Sensitivity Level	-	1	-
T_{SLD}	Lead Temperature Soldering Reflow, Pb-Free (Note 3)	-	260	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
2. This device series incorporates ESD protection and is tested by the following methods:
ESD Human Body Model tested per AEC-Q100-002 (EIA/JESD22-A114).
ESD Charged Device Model tested per AEC-Q100-011 (EIA/JESD22-C101).
Latchup Current Maximum Rating: ≤ 100 mA per JEDEC standard: JESD78, 25°C.
3. For information, please refer to our Soldering and Mounting Techniques Reference Manual, SOLDERM/D.

Table 4. THERMAL CHARACTERISTICS

Symbol	Parameter	Value	Unit
$R_{\theta JA}$	Thermal Characteristics, SOIC-8 wide body (Note 4) Thermal Resistance, Junction-to-Air (Note 5)	156 (1-Layer) 85 (4-Layer)	°C/W

4. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
5. Values based on copper area of 100 mm² (or 0.16 in²) of 1 oz copper thickness and FR4 PCB substrate.

Table 5. OPERATING RANGES (Note 6)

Symbol	Parameter	Min	Max	Unit
$V_{DD1-GND1}$	Supply Voltage, Input Side	UVLO1	20	V
$V_{DD2-GND2}$	Positive Power Supply, Output Side	UVLO2	30	V
$V_{EE2-GND2}$	Negative Power Supply, Output Side (NCD57090B)	-15	0	V
$V_{DD2-VEE2} (V_{MAX2})$	Differential Power Supply, Output Side (NCD57090B)	0	32	V
V_{IL}	Low Level Input Voltage at IN+, IN- (Note 7)	0	$0.3 \times V_{DD1}$	V
V_{IH}	High Level Input Voltage at IN+, IN- (Note 7)	$0.7 \times V_{DD1}$	V_{DD1}	V
$ dV_{ISO}/dt $	Common Mode Transient Immunity (Note 8)		100	kV/μs
T_A	Ambient Temperature	-40	125	°C

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

6. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
7. Table values are valid for 3.3 V and 5 V V_{DD1} , for higher V_{DD1} voltages, the threshold values are maintained at the 5 V V_{DD1} levels.
8. Was tested by ±1500 V pulses up to 100 kV/μs.

Table 6. ISOLATION CHARACTERISTICS

Symbol	Parameter	Conditions	Value	Unit
$V_{ISO, \text{input-output}}$	Input-Output Isolation Voltage	$T_A = 25^\circ\text{C}$, Relative Humidity < 50%, $t = 1.0$ minute, $I_{I-O} < 30 \mu\text{A}$, 50 Hz (Note 9, 10, 11)	5000	V_{RMS}
R_{ISO}	Isolation Resistance	$V_{I-O} = 500$ V (Note 9)	10^{11}	Ω

9. Device is considered a two-terminal device: pins 1 to 4 are shorted together and pins 5 to 9 are shorted together.
10. 5,000 V_{RMS} for 1-minute duration is equivalent to 6,000 V_{RMS} for 1-second duration.
11. The input-output isolation voltage is a dielectric voltage rating per UL1577. It should not be regarded as an input-output continuous voltage rating. For the continuous working voltage rating, refer to equipment-level safety specification or DIN VDE V 0884-11 Safety and Insulation Ratings Table.

NCx57090y, NCx57091y

ELECTRICAL CHARACTERISTICS $V_{DD1} = 5\text{ V}$, $V_{DD2} = 15\text{ V}$, ($V_{EE2} = 0\text{ V}$ for NCD57090B).

For typical values $T_A = 25^\circ\text{C}$, for min/max values, T_A is the operating ambient temperature range that applies, unless otherwise noted.

Under Voltage Lockout (Refer to Figure 9x)

UVLO ensures correct switching of IGBT/MOSFET connected to the driver output.

- The IGBT/MOSFET is turned-off and the output is disabled if the supply V_{DD1} drops below $V_{UVLO1-OUT-OFF}$ or V_{DD2} drops below $V_{UVLO2-OUT-OFF}$.
- The driver output does not follow the input signal on IN+ or IN- until the V_{DDX} rises above the $V_{UVLOX-OUT-ON}$ and the input signal rising edge is applied to the IN+ or IN-.
- V_{EE2} is not monitored (NCx5709zB)

With high loading gate capacitances over 10 nF it is important to follow the decoupling capacitor routing guidelines as shown on Figure 35/36. The decoupling capacitor value should be at least 10 μ F. Also gate resistor

of minimal value of 2 Ω has to be used in order to avoid interference of the high di/dt with internal circuitry (e.g. UVLO2).

After the power-on of the driver there has to be a rising edge applied to the IN+ or falling edge to the IN- in order for the output to start following the inputs. This serves as a protection against producing partial pulses at the output if the V_{DD1} or V_{DD2} is applied in the middle of the input PWM pulse.

If the V_{DD2} rises over $V_{UVLO2-OUT-ON}$ level the PWM will appear on the output after $t_{UVR2} + t_{UVR2-spread}$. The $t_{UVR2-spread}$ time is variable and is defined as a time from end of t_{UVR2} to first rising edge on IN+ input. If the V_{DD2} is starting from 0 V the time until PWM is at the output of the driver is longer than $t_{UVR2} + t_{UVR2-spread}$. This is caused by start up time of internal circuits of the driver.

ACTIVE MILLER CLAMP PROTECTION (CLAMP)

NCx5709yB supports bipolar power supply to prevent unintentional turning on.

For operation with bipolar supplies, the IGBT/MOSFET is turned off with a negative voltage through OUT with respect to its emitter. This prevents the IGBT/MOSFET from unintentionally turning on because of current induced from its collector to its gate due to Miller effect. Typical values for bipolar operation are $V_{DD2} = 15\text{ V}$ and $V_{EE2} = -5\text{ V}$ with respect to GND2.

Driver version A/D/F supports unipolar power supply with active Miller clamp.

For operation with unipolar supply, typically, $V_{DD2} = 15\text{ V}$ with respect to GND2, and $V_{EE2} = \text{GND2}$. In this case, the IGBT/MOSFET can turn on due to additional charge from IGBT/MOSFET Miller capacitance caused by a high voltage slew rate transition on the IGBT collector/MOSFET drain. To prevent IGBT/MOSFET to turn on, the CLAMP pin is connected directly to IGBT/MOSFET gate and Miller current is sunk through a low impedance CLAMP transistor. When the IGBT/MOSFET is turned-off and the gate voltage transitions below V_{CLAMP} the CLAMP output is activated.

Figure 28. Current Path with Miller Clamp Protection

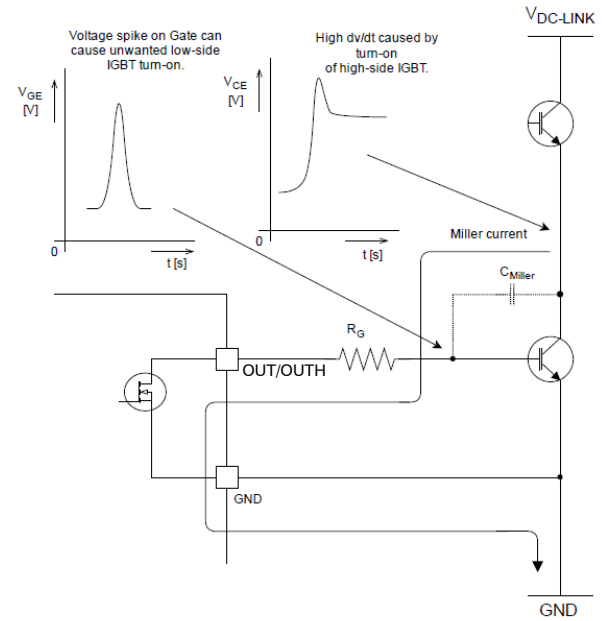

Figure 29. Current Path without Miller Clamp Protection

Non-inverting and Inverting Input Pin (IN+, IN-)

The driver has two possible input modes to control IGBT/MOSFET. Both inputs have defined minimum input pulse width to filter occasional glitches.

- Non-inverting input IN+ controls the driver output while inverting input IN- is set to LOW
- Inverting input IN- controls the driver output while non-inverting input IN+ is set to HIGH

WARNING: When the application uses an independent or separate power supply for the control unit and the input side of the driver, all inputs should be protected by a serial resistor (In case of a power failure of the driver, the driver may be damaged due to overloading of the input protection circuits)

Power Supply (V_{DD1} , V_{DD2} , V_{EE2})

The driver variant A/C/D/E and F are designed to support unipolar power supply.

The driver variant B is designed to support bipolar power supply.

Suitable external power capacitors are required for reliable driving of IGBT/MOSFET gate with high current. Parallel combination of 100 nF + 4.7 μ F low ESR ceramic capacitors is optimal for a wide range of applications using IGBT/MOSFET. For reliable driving of IGBT modules (containing several parallel IGBT's) with a gate capacitance over 10 nF a higher decoupling capacity is required (typically 100 nF + 10 μ F). Capacitors should be as close as possible to the driver's power pins. The recommended layout is provided in the Figure 35 and 36.

- In bipolar power supply the driver is typically supplied with a positive voltage of 15 V at V_{DD2} and negative voltage -5 V at V_{EE2} (Figure 30). Negative power supply prevents a dynamic turn on through the internal IGBT/MOSFET input capacitance
- In Unipolar power supply the driver is typically supplied with a positive voltage of 15 V at V_{DD2} . Unwanted turn-on caused by the internal IGBT/MOSFET Miller capacitance could be prevented by Active Miller Clamp function (variant A/D/F). CLAMP output should be directly connected to IGBT/MOSFET gate (Figure 28)

NOTES:

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
2. CONTROLLING DIMENSION: MILLIMETERS
3. DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE PROTRUSION SHALL BE 0.10 mm IN EXCESS OF MAXIMUM MATERIAL CONDITION.
4. DIMENSIONS D AND E DO NOT INCLUDE MOLD FLASH, PROTRUSIONS, OR GATE BURRS. MOLD FLASH, PROTRUSIONS, OR GATE BURRS SHALL NOT EXCEED 0.15 mm PER SIDE. DIMENSIONS D AND E ARE DETERMINED AT DATUM H.
5. DATUMS A AND B ARE TO BE DETERMINED AT DATUM H.
6. A1 IS DEFINED AS THE VERTICAL DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT ON THE PACKAGE BODY.
7. NO JEDEC STANDARD AT TIME OF SETUP.
